

# Need A New Muffler?

## Of Elliptically Curved Structural Steel?

- 52 tons of W12 x 58# beams roll-curved the “hard way” to form a series of half ellipses with radii of approximately 34', 24', and—an extremely tight—12' radius.
- The steel fabricator praised the AESS roll-curved beams for being distortion-free and for having a profile tolerance of less than 3/8": "The product that we got from Chicago Metal Rolled Products was almost perfect—they've always done a great job for us."
- The resulting tube muffles the train noise as the “EI” passes over the student center designed by Rem Koolhaus at the Illinois Institute of Technology.
